

The Window Valet

Step-by-step breakdown for the three items not yet started

Prepared for Josh LeClair by John Carlo Caintic · Marketing Strategy & Automation · Updated August 29, 2026

Seven of ten Week 3-4 priorities are done. This covers the remaining three, broken into the actual steps each one takes to complete. Item 2 was expanded on 2026-08-29 after Josh raised the full GHL · MyBlindCo · QuickBooks · Mapsly customer-journey project as a new top priority.

1. Workflow Cleanup & Documentation

Why this matters: this week alone turned up a workflow silently stuck in Draft, a workflow with no exclusion for existing customers, and two reminder emails disagreeing on what kind of appointment was even happening. None of those were visible until someone went looking. A documented inventory is what prevents the next one from sitting broken for months before anyone notices.

- 1. Pull a full inventory.** List every workflow in the account: name, status (Active/Draft/Published), and last modified date.
 - 2. Flag anomalies first.** Anything sitting in Draft that should be live, and anything untouched for months, gets checked before anything else.
 - 3. Sort by function.** Group workflows into categories: lead intake, appointment lifecycle, response & escalation, nurture, partner, recovery, internal/admin.
 - This makes it obvious where duplication or overlap is happening, like the two mismatched appointment reminder emails found this week.
 - 4. Write a plain-English description for each.** One paragraph per workflow: what triggers it, what it does, who it notifies, how it exits. No jargon, written so anyone on the team could read it and understand the workflow without opening the builder.
 - 5. Fix or consolidate overlaps.** Where two workflows are doing the same job with inconsistent wording or logic, merge them or correct the mismatch.
 - 6. Archive what's genuinely dead.** Anything confirmed obsolete gets formally archived, not just left running unused.
 - 7. Build the reference index.** A single spreadsheet or doc: workflow name, purpose, trigger, status. The lookup table so nobody has to open the builder just to check what something does.
 - 8. Set a recurring review cadence.** Quarterly is reasonable, documentation only stays useful if it gets revisited, not written once and forgotten.
-

2. Customer Journey & Cross-System Integration

Elevated to a top priority by Josh (2026-08-29): follow a customer from the original lead all the way through the completed sale and see the actual financial result, connecting GHL, MyBlindCo, QuickBooks, and Mapsly. Approached in stages, not built all at once.

HOW THE FOUR SYSTEMS SPLIT TODAY

System	Owns
GHL	Front end of the customer journey: leads, source/attribution, communication, follow-up, sales appointments, salesperson assignment, pipeline, cancellations/no-shows, marketing automation. Stays the CRM and lead-management system.
MyBlindCo	Everything after the sales appointment: quotes, products, measurements, pricing, orders, jobs, installation scheduling, job status. The installation calendar lives here, separate from GHL's sales-appointment calendar.
QuickBooks	Financial accounting: revenue, payments, expenses, the financial result of each job.
Mapsly	Geographic intelligence, eventually surfacing best ZIP codes, revenue/profit clusters, and partner/marketing opportunities.

RESEARCH ALREADY COMPLETED

- 1. QuickBooks ↔ GHL is a solved problem.** GHL has a fully native QuickBooks integration (Settings → Integrations → QB Connect), no middleware required. This is a configuration task, not a development project.
- 2. Mapsly ↔ GHL is also already solved.** Mapsly has a native, bi-directional, real-time API connector built specifically for HighLevel, pulling GHL data onto the map and pushing edits back, including route optimization by drive time and territory assignment. A real existing product to configure, not something to build from scratch, and it directly covers the scheduling-intelligence goal below.
- 3. MyBlindCo ↔ GHL is the genuinely custom piece.** No public API or Zapier integration exists for MyBlindCo. The existing "My Blind Co, GHL Erica/Justin" workflow is a one-way custom webhook, confirmed this week that it doesn't send SMS. This is the one connection nobody's solved for us already, and matches Josh's own instinct that it's the right starting point.

WEEK 3-4 DELIVERABLES (MAPPING, NOT BUILDING)

- 1. Document the full customer journey.** Lead → GHL contact → GHL opportunity → sales appointment → salesperson → MyBlindCo customer → MyBlindCo quote → order → installation → QuickBooks transaction/payment.
- 2. Determine reliable cross-system customer matching.** Evaluate customer ID, email, phone, job number, opportunity ID, quote number, and order number, find a way to connect records without creating duplicates or mismatched customers.
- 3. Determine what data is actually accessible from each platform.** GHL API/webhooks (well understood at this point), MyBlindCo API/integration capability (still needs direct confirmation with MyBlindCo or Josh, nothing surfaced publicly), QuickBooks API (native, confirmed), Mapsly integration (native, confirmed).
- 4. Build a proposed data map.** Show exactly which system owns each piece of information, GHL Lead Source → GHL Appointment → Salesperson → MyBlindCo Quote → Order → Installation → QuickBooks Revenue →

Gross Profit.

5. **Identify the minimum viable integration.** Josh's own working assumption, and ours too given the research above: GHL opportunity → MyBlindCo quote/order first, connecting marketing and sales activity to actual sales, before adding QuickBooks financials on top.
6. **Begin designing the reporting structure.** Define where each number will come from: lead source, salesperson, appointments, quotes, sales, closing percentage, average sale, revenue, gross profit, gross profit percentage, ZIP code, product type, install status. Not the dashboard itself yet.
7. **Factor scheduling into the design, read-only, never a two-way write.** Sales appointments live in GHL, installations live in MyBlindCo, and that stays true, no calendar sync between them. Long term, build intelligence across both based on geography, drive time, existing appointments, salesperson/installer availability, job duration, and workload, surfaced as suggestions, not automated writes back into either calendar. This is where the native Mapsly connector does the heavy lifting.
8. **Sequence Mapsly after the data foundation.** Once GHL and MyBlindCo data are properly connected, use Mapsly to surface strongest ZIP codes, highest revenue/profit areas, installation and appointment clusters, and partner/marketing opportunities.

Important history (from Josh, 2026-08-29): a two-way scheduling sync between GHL and MyBlindCo existed once before, under a previous team, and it was shut down. The failure mode was double bookings, a cancellation on one side wouldn't reliably cancel on the other, leaving a stale appointment behind and confusing everyone. That's exactly why sales appointments and installations were deliberately split, GHL for sales calls, MyBlindCo for service/installs, not an oversight to fix, a hard-won decision to respect. The design principle above (read-only cross-system intelligence, no calendar writes crossing between systems) is specifically meant to get the scheduling-efficiency benefit Josh wants without recreating that failure.

STILL NEEDED BEFORE THE CURRENT-STATE MAP CAN BE FINISHED

1. Confirm whether the native QuickBooks integration is already connected in this account, or still needs setup.
2. ~~Confirm with MyBlindCo directly what API, export, or webhook-receiving capability exists on their end.~~ Confirmed by Audra McGrath (COO, MyBlindCo): a direct API integration is available independent of my5starz, syncing contact data, appointment data, contact status, and order status into GHL so drip campaigns and automations can trigger correctly. There's a monthly fee, amount still to be confirmed.
3. Pull the exact fields the existing MyBlindCo webhook sends today.
4. ~~Confirm whether a Mapsly subscription is already active, or this is a fresh signup.~~ Confirmed: active Enterprise plan, 3 seats, \$210/month. Routing credit usage is very low (96 of 2,400), and AI credits and transcription minutes are both unused, real paid capacity ready to put to work once the HighLevel connector is set up.

3. Scheduling / Mapsly Optimization

Updated finding: Mapsly already has a native, bi-directional, real-time connector built specifically for HighLevel, this is a real existing product to configure, not something to prototype from scratch. That simplifies this item considerably, and it now overlaps directly with item 2 above, since Josh wants Mapsly sequenced in only after the GHL-MyBlindCo data foundation is in place.

- 1. Confirm account status.** Is there already an active Mapsly subscription, or is this a fresh signup?
- 2. Connect the native HighLevel integration.** No custom build required, this is a direct connector Mapsly already maintains.
- 3. Map today's process.** Document how appointments are currently assigned and routed right now, likely based on availability alone, not location or drive time.
- 4. Hold full rollout until the data foundation lands.** Per Josh's sequencing in item 2, Mapsly's real value (best ZIP codes, revenue/profit clusters) depends on GHL and MyBlindCo data being connected first. Early routing/territory features can still be explored now, but the reporting layer waits.
- 5. Run a small prototype once connected.** Route a handful of real upcoming appointments through Mapsly's optimization logic and compare the result to how they'd have been scheduled manually.
- 6. Document the findings.** Was there a measurable efficiency gain (drive time, appointments per day, fuel)? Use that to make a clear go/no-go recommendation before considering a full rollout.

Part of the ongoing GHL stabilization work under the Week 3-4 roadmap.
